TITLE : UNDERWATER INSPECTING DEVICE

ABSTRACT : PURPOSE: To facilitate the control over the position and attitude of a diving device body and provision of a probe, by adding a screw for each direction to the diving device body.

CONSTITUTION: The underwater inspecting device 21 is drooped into water from a crane, etc., and then holds itself vertically constant in the water because its specific gravity is 1 and the device is positioned below the center of buoyance. Then, the underwater inspecting device 21 moves down in the water with a screw 36 and also moves right and left on a horizontal plane with screws 32 and 33 to generate a thrust to a desired position in a nuclear reactor pressurized container 22 and further in the opposite direction with a screw 34, so that the device is rotated. Then, the probe 43 is set at a desired flaw detection position by a manipulator 42 and a manipulator mechanism 44 for balancing after the device moves to a desired position on the internal wall of the container 22.
